

Natural Features of the Kawartha Nordic Ski Club Property

Kawartha Nordic Ski Club Inc. Property
Part Lots 12, Concession 6, and Part Lots 11 and 12, Concession 7
Geographic Township of Burleigh,
County of Peterborough

Prepared for
The Kawartha Nordic Ski Club Inc. (KNSC)

Prepared By:
KNSC Natural Heritage Committee

Primary Authors: David Bell and Mike McMurtry

Original Maps: Mark Woolley, Yellow Data Clarity

Final Edits: Erin McGauley and Sue Sauve

November 2023

Background Information

This report was generated with direction from the Board of Directors who approved the Terms of Reference for the KNSC Natural Heritage Committee in July 2020 as stated here:

“The Kawartha Nordic Natural Heritage Committee (the Committee) shall work towards building a Natural Heritage Inventory and recommendations for Land Stewardship for the Kawartha Nordic Ski Club Property and Crown lands used by Kawartha Nordic . The initial focus will be on the Kawartha Nordic property.”

Extensive field work was conducted by members of the committee and a report prepared by Mike McMurtry and David Bell. The draft report was presented to the Board of Directors in October, 2021. The final report - including new mapping products - is now complete and the KNSC Natural Heritage Committee would be pleased to present it at the 2023 AGM.

Executive Summary

The Kawartha Nordic Ski Club Inc. (KNSC) owns and manages a 345-acre property along Hwy. 28, north of Eel’s Creek. This report is the product of over 33 field days of volunteer effort, over 28 bird counts, the compilation of roughly **840 species of flora and fauna from iNaturalist** and the confirmed documentation of **12 Species at Risk*** supported by the property. **Detailed maps of wetlands and ecological communities documented via field work are shown in Figures 2 & 3, contained in this report.**

The KNSC property is a natural gem made up of forests, wetlands, open rock barrens and meadows. Surveys for this project found that the property supports 356 species of flora and 595 species of wildlife!

When compared with other properties in the area, these numbers are staggering. The nearby Ingleton-Wells property, for instance, hosts 96 documented plants and 30 animals, whereas Big/Boyd Island supports 361 plants and 68 animals (KLT assessment/inventory reports, personal communication, Thom Unrau, Aug. 2021).

**SAR in this count are: Chorus Frog, Snapping Turtle, Midland Painted Turtle, Eastern Wood Pewee, Nighthawk, Black Ash, Barn Swallow, Bald Eagle, Canada Warbler, Wood Thrush, Evening Grosbeak, Monarch Butterfly*

While it is recognized that survey efforts at the above-noted comparison properties varied from the intense survey efforts at KNSC, the results are still remarkable. Owing to this species diversity and the property's relative lack of human disturbance, it is likely that almost all the pre-settlement complement of plants and animals are present.

Let's begin with the forests. The forests of the KNSC are comprised of mixed and deciduous tree species, and though there has been logging on the property, there are magnificent older specimens of White Oak, White Ash, Silver Maple, Sugar Maple & Eastern Hemlock.

The KNSC forests are connected to large areas of Crown Land including the Peterborough Crown Game Preserve, Sharpe Bay Fen Conservation Reserve and the Kawartha Highlands Provincial Signature Park. These connections provide movement corridors for wildlife and provide habitat for 'deep woods' or area-sensitive forest species that require extensive forested areas. Woodland area-sensitive birds such as the Ovenbird, Scarlet Tanager and Wood Thrush have been documented at KNSC, and woodland birds of prey (raptors) including Broad-winged Hawk, and Barred Owl nest in KNSC's forests. These species only occur when large woodlands predominate.

The property also contains a rare forest type: one forest stand ('w6' from the Forest Mgmt. Plan) is made up of 18% white oak trees, which is considered rare in this ecoregion. Both White and Red Oaks produce acorns which function as energy-rich winter foods for wildlife. Forests with Red Oaks that produce acorns in quantity are called 'mast producing areas' and are important to wildlife winter survival. Terrestrial Community 11, dominated by Red Oak, is one such important area at KNSC. Finally, the property provides habitat for Ontario's Endangered Black Ash tree, found in forested wetlands. Black ash is a species important to indigenous culture for basket making.

Ecologically speaking, the KNSC property is diverse! In addition to the forested areas there are large and varied wetlands which store carbon and filter local water. Upland meadows create gaps in the canopy and open rock barrens provide yet another type of habitat.

Wetlands: The size and natural condition of the wetlands at KNSC suggests they would be designated as Provincially Significant, were they formally evaluated via the Ontario Wetland Evaluation System (OWES).

These wetlands provide amphibian breeding habitat, and observations (in W01 & W11) of both Midland Painted Turtles and Snapping Turtles on the property suggest that KNSC provides significant turtle overwintering areas. Outstanding examples of wetland types (those with the least disturbance based on floristic quality) are shown below.

High Ranking Wetland Types and Sites: Floristic Quality Assessment Scores $\geq 5.0^*$

Community Type	Wetland Sites	Details
Community 5	W02, 04, 05, 06, 10	Organic meadow marsh, high species diversity
Community 7	W03	Organic thicket swamp
Community 8	W04 & 06	Open water marsh with organic soils
Community 9	W17	Intolerant hardwood swamp with Black Ash
Community 18	W11	Open water marsh with mineral soil

**Analysis based on Mean Coefficient of Conservatism scores, Native & Non-Native Species.*

In addition, fish habitat is found in Wetlands 01, 10 & 11, and fishless ephemeral wetlands (vernal pools) on the property likely provide habitat for amphibians such as salamanders, which have yet to be documented on the property.

Uplands: Other habitats on the property include open rock barrens and meadows. Of the upland areas, those with the best condition according to the floristic quality analysis are shown below.

High Ranking Upland Sites: Floristic Quality Assessment Scores $>3.8^*$

Community Type	Upland Site Details
Community 3	Moist Eastern Hemlock Eastern White Cedar forest
Community 12	Dry, Sandy Red Pine – White Pine Conifer forest
Community 15	American Beech, Sugar Maple, Basswood, Red Oak forest

**Analysis based on Mean Coefficient of Conservatism scores, Native & Non-Native Species.*

Species At Risk: Natural heritage assessments are often the first exercises in documenting special features and compiling nature observations on a property. In the case of the KNSC, the work produced via this report has brought to light the property’s importance in providing **habitat for 12 species at-risk as well as confirmed and candidate significant wildlife habitat.** Additional field efforts are likely to uncover more at-risk species and significant wildlife habitat (which is protected through Provincial policy).

KNSC Lands are Provincially Important! Field work at the KNSC found both rare species and Provincially significant habitats. Some highlights:

- **at-risk Snapping Turtles and Chorus Frogs**
- **rare White Oak forests**
- **endangered Black Ash trees**
- **at-risk birds including Evening Grosbeak and Canada Warbler**
- **endangered Monarch butterfly, and**
- **Broad-winged Hawk and Barred Owl nesting sites.**

The key findings of this report, as they relate to Provincial designations, protections and species-at-risk observations are listed in the following table.

Provincially Designated Species and Habitats at KNSC

Designation	Site ID	Details / Information Sources
SWH – Turtle Wintering Areas	W01 & W11	Documented presence of Midland Painted and Snapping Turtles
SWH – Mast Producing Area	C11	Red Oak dominated forest community
SWH - Rare Forest Type	C02	Forest Management Plan shows one stand ('w6') with 18% white oak. This aligns with Community 02.
SWH – Woodland Raptor Nesting		Broad-winged Hawk & Barred Owl nesting per Ontario Breeding Bird Atlas

SWH: Habitat for Species of Special Concern		Confirmed on site (subnational rank): Bald Eagle (S2N, S5B) Canada Warbler (S4B) Common Nighthawk (S4B) Eastern Wood Pewee (S4B) Monarch butterfly (S2N, S4B) Snapping Turtle (S4) Wood Thrush (S4B)
Federal SAR: Western Chorus Frog (THR), Evening Grosbeak & Midland Painted Turtle (SC)		Confirmed on site. Species designated by COSEWIC
Habitat of SAR Designated as THR or END: Black Ash tree, Barn Swallow	C19 (Black Ash)	Both confirmed on site. Black Ash exists in C9, C14 & C19, but is the dominant overstory in C19. Swallow nesting habitat to be confirmed.
Habitat of SAR Designated as THR or END: Bobolink, Meadowlark, Cerulean Warbler, Golden Eagle		Species observed on site but with unsuitable or marginal breeding habitat. Breeding or foraging habitat is required for SWH designation.
Potential SAR Habitat		Studies needed to confirm the following species given that suitable breeding habitat/growing conditions exist: Eastern Whip-poor-will, Spotted Turtle, American Ginseng, Eastern Hog-nosed Snake, Blanding's Turtle.
Fish Habitat	W01 W10 W11	Baitfish. Protected waters and connecting waterways (Fisheries Act)

Human Impacts: The trails, roads and landscaping activities on the property have brought with them several non-native species that have impacted the condition of adjacent ecological communities. That said, the overall condition of most communities, especially the wetland communities, is very good.

The Natural Features report is presented in the following pages, with more details on the field work, data compilation and analysis of the ecological features of the KNSC.

In conclusion, the KNSC property supports a variety of habitat types in excellent condition and these large, natural, flourishing systems support flora and fauna, including several at-risk species.

Using this report as a springboard, the KNSC could consider creating 'zones' of high sensitivity for wildlife, and identify 'zones' of lower sensitivity, so that human management of the property could best support and celebrate the natural heritage values by not encroaching on the most valuable assets of the land.

Building on this report, KNSC could consider engagement with tax exemption programs (managed forests and conservation lands) and partnerships to help further evaluate the area's rich natural heritage features. Partnerships with Kawartha Land Trust's *Partners in Conservation* program as well as the Peterborough Field Naturalists and post-secondary institutions could facilitate the completion of additional studies and inventory work.

1 Introduction

Guided by direction from the Kawartha Nordic Ski Club (KNSC) board, several members and other keen naturalists began studying and mapping out the natural features of the KNSC property in 2020. The Kawartha Land Trust has also partnered on this initiative and has contributed mapping support and stewardship advice. Yellow Data Clarity worked with the field-generated data files and created the three main maps of the KNSC property to document wetlands, ecosites and sensitive features. This report presents a summary of the work of all of the organizations and people noted above. The initial products of the work are a description of the ecological communities that are found on the property and a list of plants and animals associated with those communities. In addition, the presence of the following significant natural features on the site were determined:

- a. significant wetlands (including significant coastal wetlands).
- b. significant habitat of endangered or threatened species.
- c. significant Areas of Natural and Scientific Interest (ANSIs).
- d. significant wildlife habitat (SWH); and
- e. fish habitat.

2 Site Description

The Kawartha Nordic Ski Club Inc. property is located at Part Lots 12, Concession 6, and Part Lots 11 and 12, Concession 7 Burleigh Twp. Peterborough County (Fig. 1). The site is approximately 345 acres. The property is in the Eel's Creek watershed, which, in turn, drains to Stoney Lake. The property is surrounded by a number of areas important for conservation. Immediately adjacent to the property are the Peterborough Crown Game Preserve, other Crown lands including the Sharpe Bay Fen Conservation Reserve, the Kawartha Highlands Signature Site Park, and, only about 5 kilometres to the east, Petroglyphs Provincial Park. The property is within the Bancroft Ecodistrict (5E-11, Wester et al. 2018), which is characterized by undulating topography controlled by Precambrian bedrock and a variable layer of acidic morainal material. There are also some areas of base-rich (e.g., marble, calc-silicate) morainal material in this ecodistrict that contribute to diversity of the flora (Wester et al. 2018).

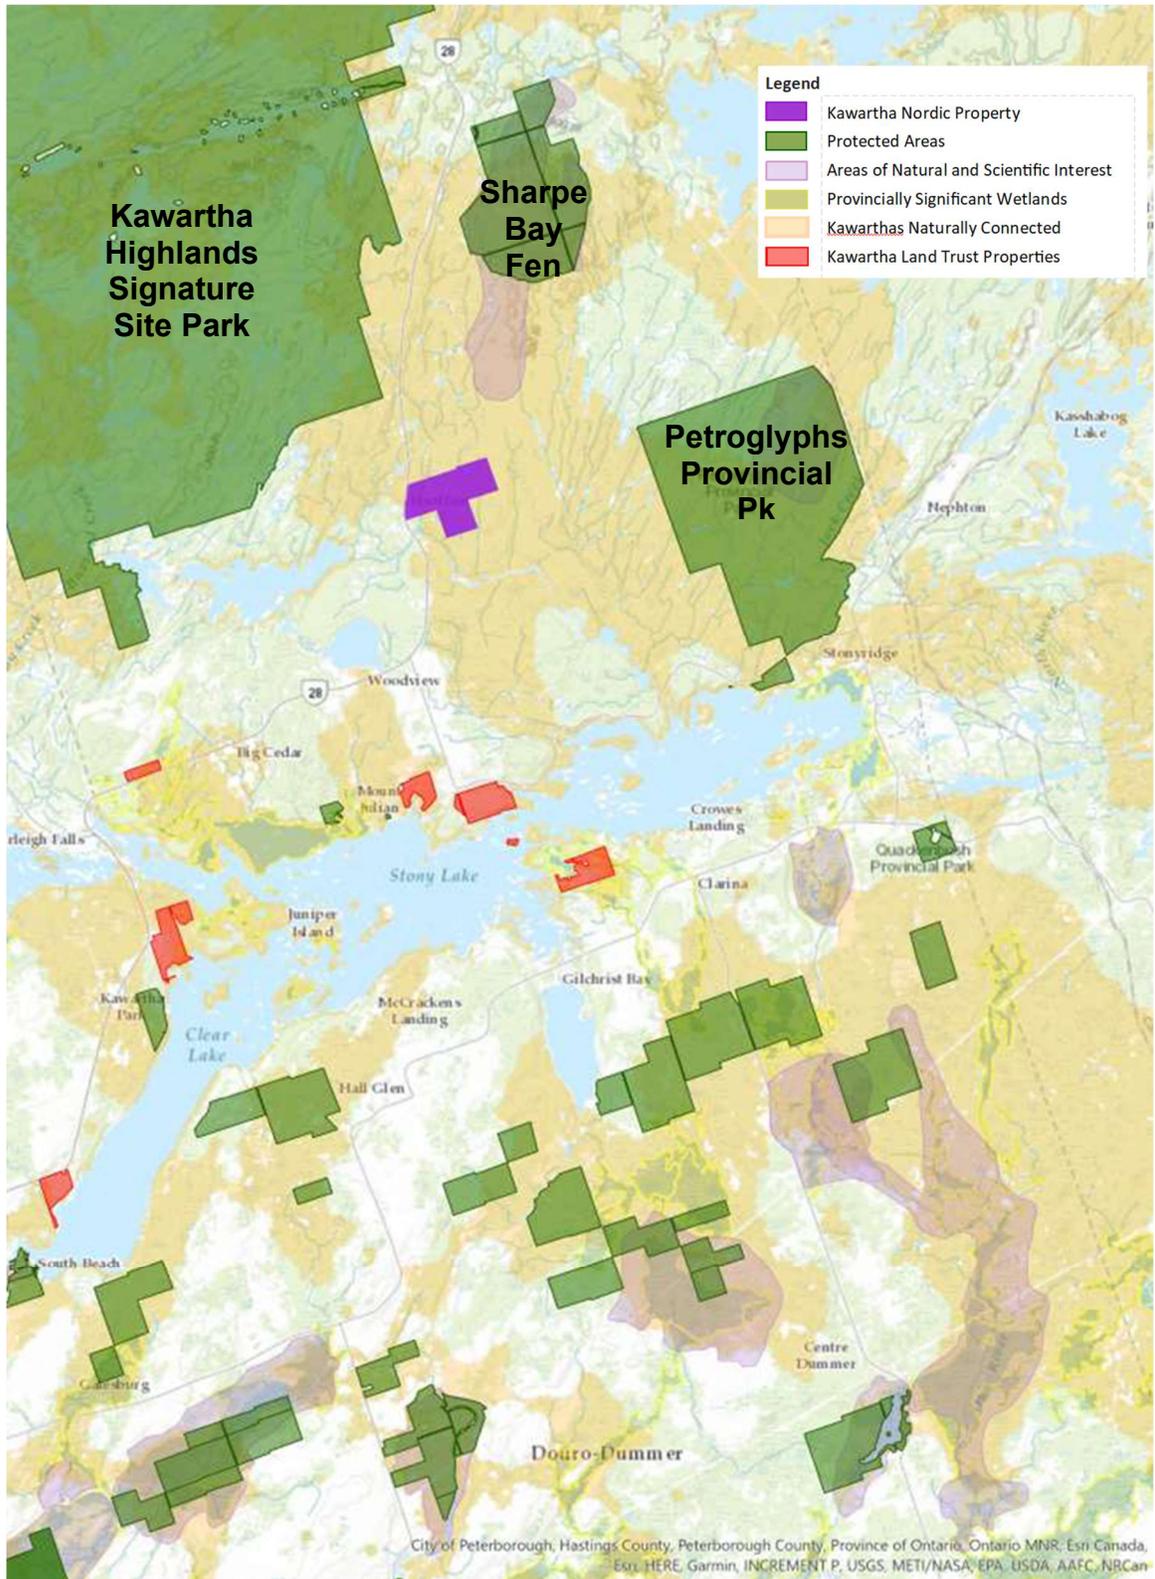

Figure 1: Location of the Kawartha Nordic Ski Club property with nearby protected areas.

The property itself contains a diversity of wetlands and forests. The built features include a club cabin and trailers, a large parking lot and several storage buildings, as well as ski and snowshoe trails. Main trails leading from the cabin, the Beaver and Trillium trails have had a layer of gravel applied to them and the contour has been altered in places.

3 Methodology

In addition to personal observations, background information concerning natural environment features was obtained from the following sources:

- The [MNRF Make A Map: Natural Heritage Areas site](#) was used to identify any Natural Heritage Features on or near the site. This site also identified any Species at Risk (SAR) reported in the area.
- [Atlas of the Breeding Birds of Ontario](#) (ABBO) 2001-2005 (Cadman, et al., 2007).
- Site visits were conducted on May 17, 28, June 3, July 10, August 20, 2020 and May 4, 2021. Field observations were used to identify the various species of flora and fauna observed on the property and in the adjacent lands. Also, the habitat was classified to the ecosite level using the following manual:
OMNR. 2009. Ecological Land Classification field manual – operational draft, April 20th, 2009. Ecological Land Classification Working Group. Ont. Min. Natural. Resources. Unpublished manual. Also, the GLSL Factsheets, 2015.
- Observations from [iNaturalist](#) (Levatich and Ligocki, 2020) and eBird observations from 2020 to May 14, 2021 were also imported into the database. Only observations of species included in the NHIC database were imported.

4 Results

4.1 Wetlands

The mapping from MNRF (Make A Map) was used as a baseline and many of the features are shown in Fig. 1. Notably, wetland boundaries identified via the MNRF mapping tool are not very accurate. The following map shows field-verified wetlands, identified as W1-17 shown against an aerial photograph of the site.

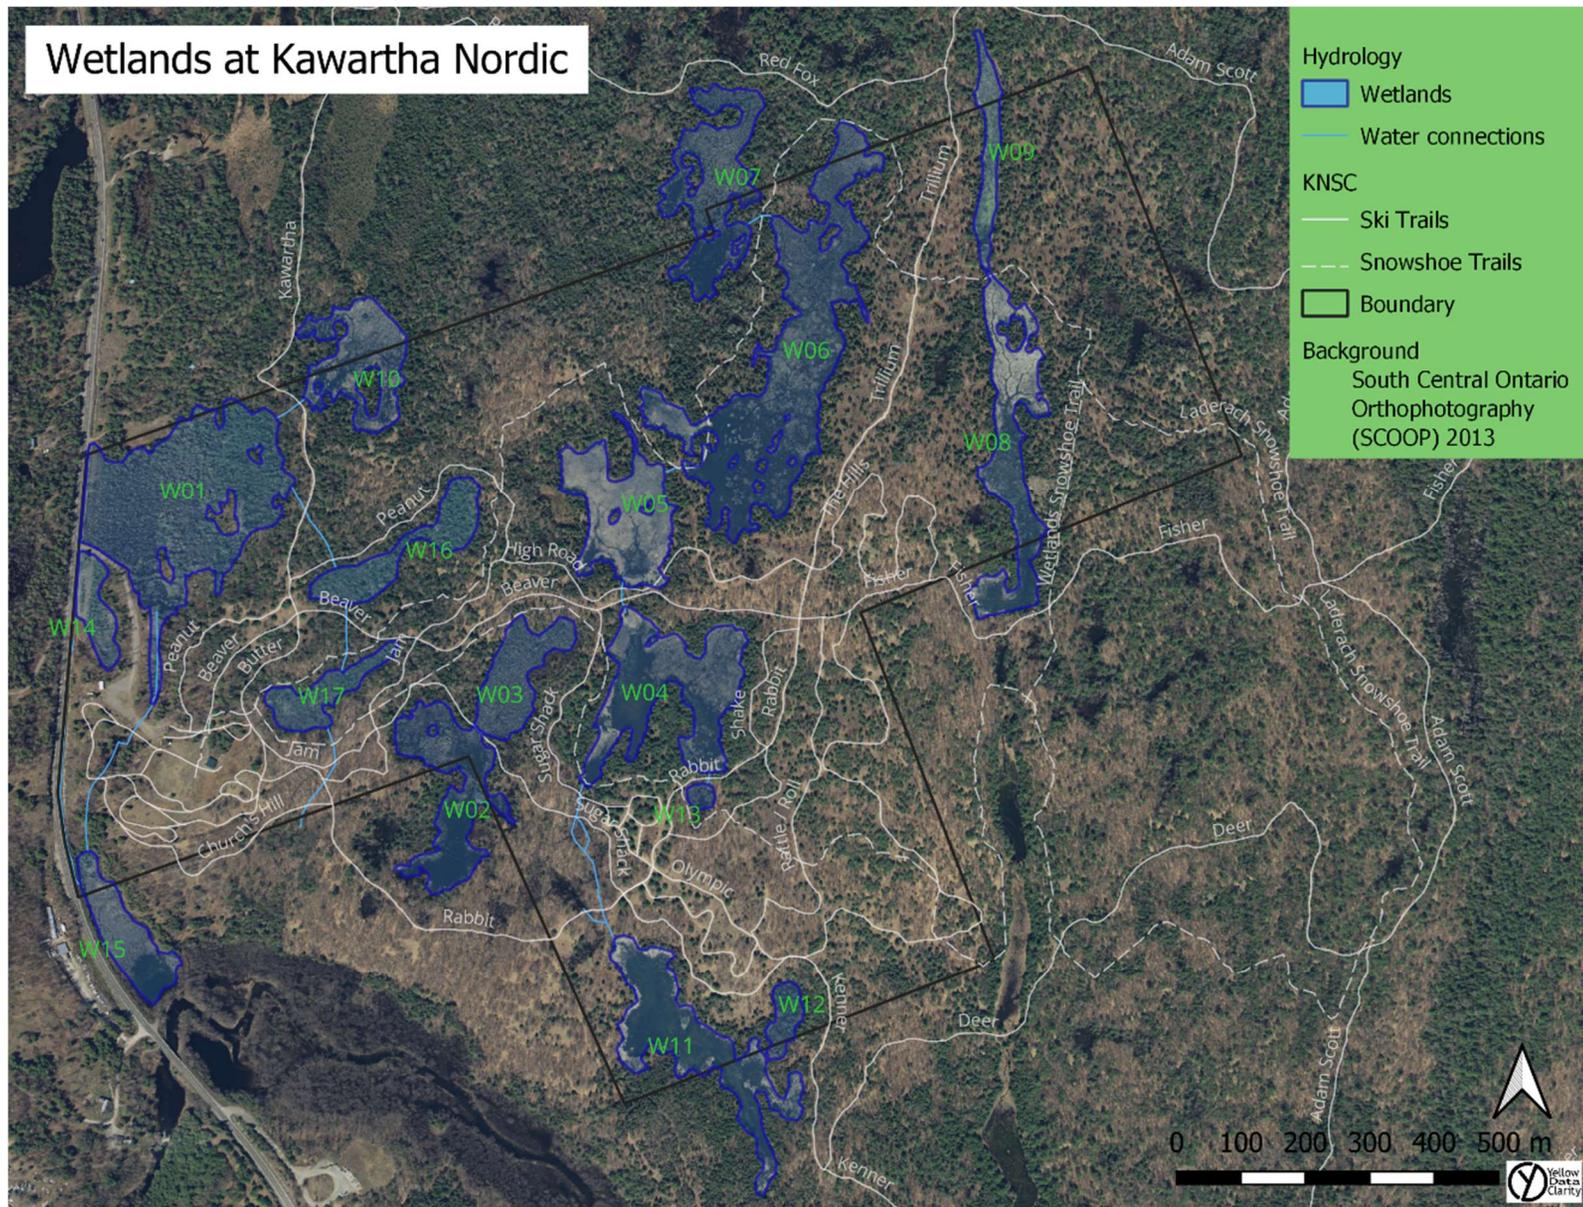

Figure 2: Wetlands at the Kawartha Nordic Ski Club

4.2 Ecological Land Classification for Ontario

The Ecological Land Classification for Ontario (ELC), (OMNR 2009) is a comprehensive and consistent approach for ecosystem description, inventory, and interpretation. It provides methods for identifying and mapping valuable Natural Heritage Features and Areas. The ecosite is a mappable landscape unit that reflects a consistent set of environmental factors (e.g., geology and soils) resulting in specific plant communities. The ecosites identified on the property are in the Great Lakes – St. Lawrence Geographic Range, the Georgian Bay Ecoregion 5E and the Bancroft Ecodistrict 5E – 11. Ecosites are those developed for the Great Lakes – St. Lawrence Geographic Range (OMNR 2009). In this report, we use the terms ecosite, ecological community, and community interchangeably.

4.2.1 Community Descriptions

The ecological communities of the property were each visited on the ground, mapped out and are described in the following section. Each community is identified by number (C01 = Community 01) and by their Ecological Land Classification technical code (G030N, per OMNR 2009). Figure 3 shows all communities and wetlands on the site along with some key ski trails to help readers orient themselves.

Some ecological communities are found in multiple *locations* on the KNSC property and this is reflected in the community description i.e. Community 08 (Organic Open Water Marsh) is found in Wetlands 1, 4, 6 and 8. And finally, some wetlands are composed of *multiple ecological communities*, such as Wetland 04, which has Open Water Marsh (C08) in deeper areas and Meadow Marsh (C05) in shallower areas.

On the map (Fig. 3), you may also note that areas are coded as 'unsurveyed pockets'. These were islands or wetlands identifiable as communities via aerial photograph interpretation, but not formally surveyed for their ecological composition. Flora documented in each ELC Community is documented and analyzed in Appendix I, while wildlife species observed in each community are listed in Appendices II and III.

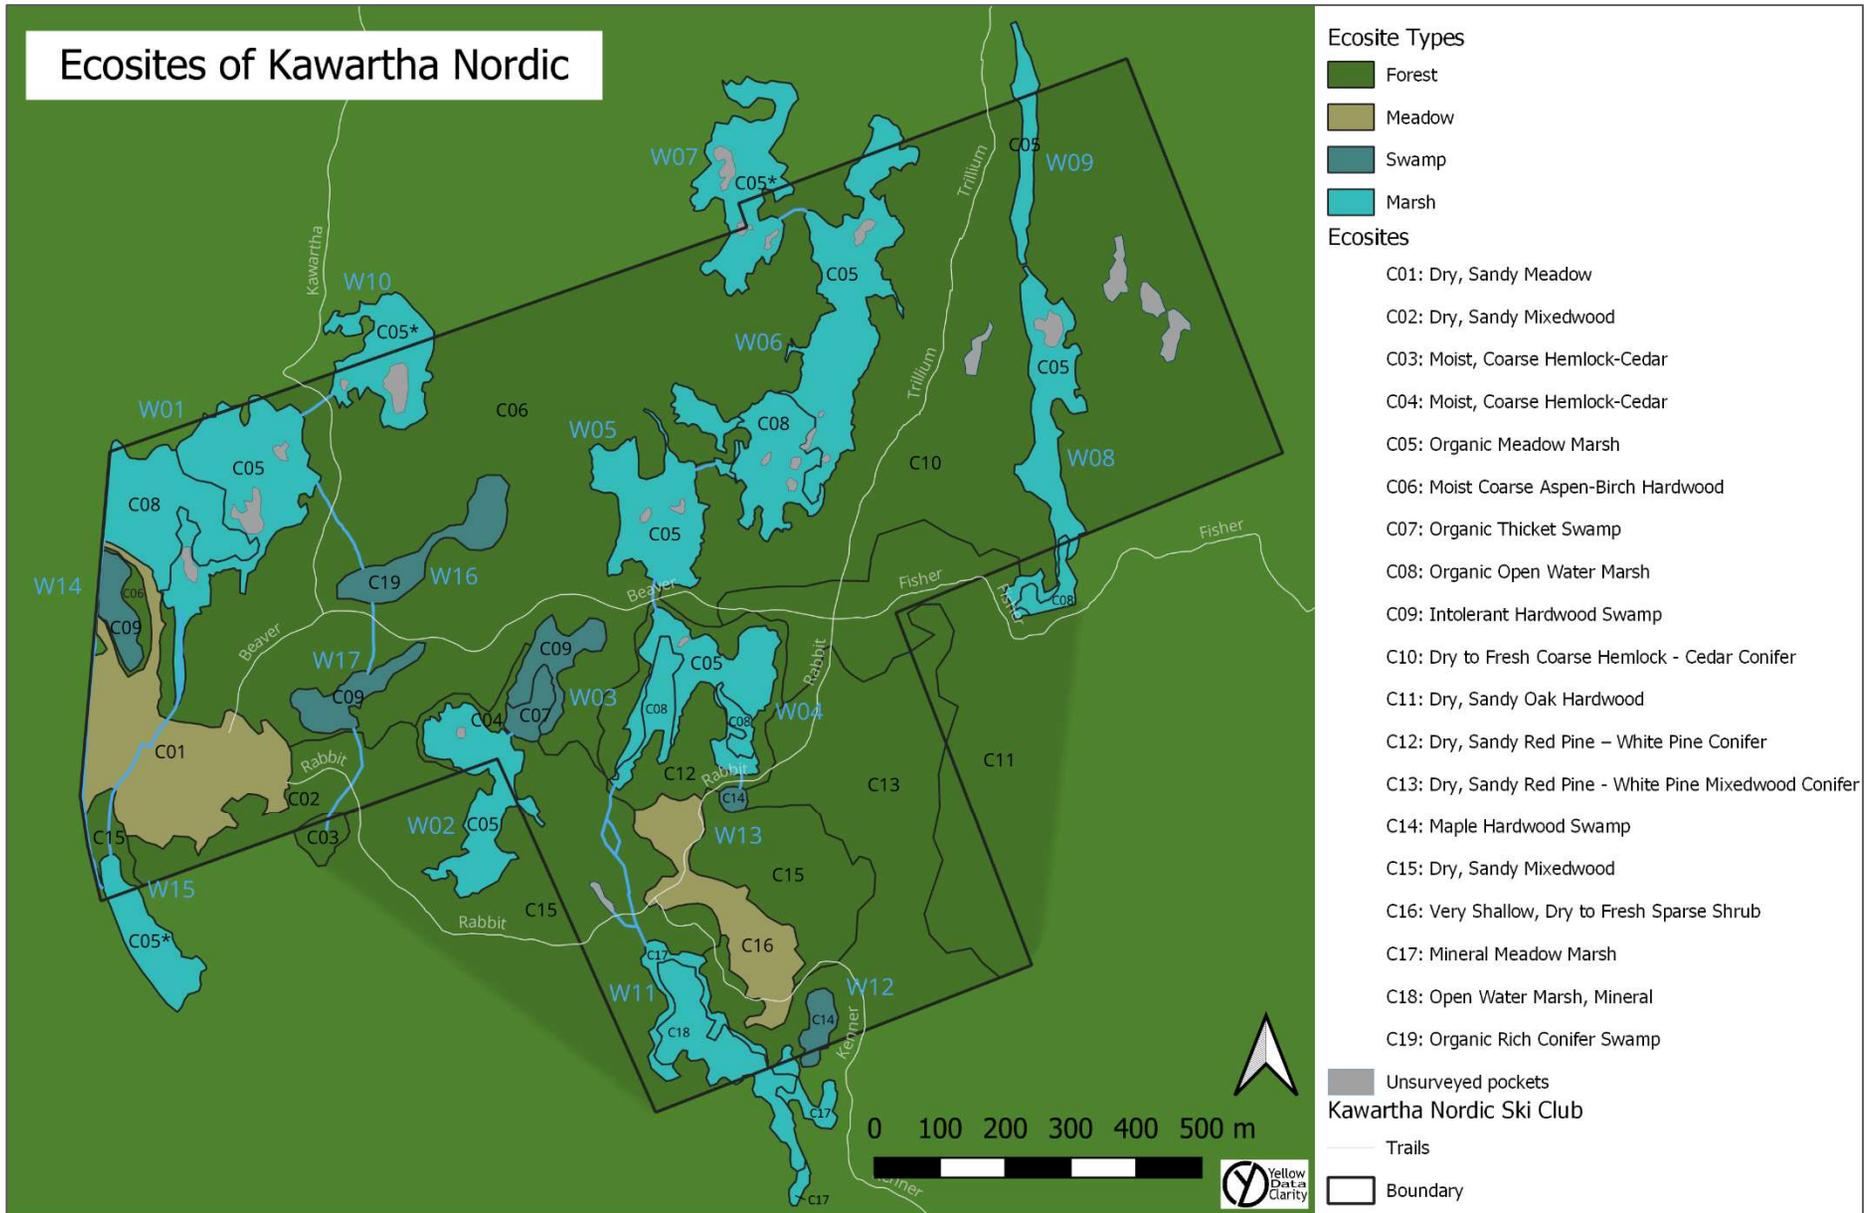

Figure 3: Ecosites and wetlands at the Kawartha Nordic Ski Club.

Community 01: Dry, Sandy Meadow Ecosite (G030N).

C01 is an herbaceous (forb and/or graminoid) dominated community. Scattered small, open-grown trees and shrubs are present, however neither exceed 10% absolute cover. Tree species include Sugar Maple, Red Maple, Trembling Aspen, Large-Toothed Aspen, White Ash and Green Ash, Black Cherry, and Bur Oak. Herbaceous species include Poverty Oat Grass, Bracken Fern, and Smooth Brome. Substrate is sandy to coarse loamy, mostly > 15 cm deep and dry to fresh. (Fig. 4).

This community is in the western section of the property where the road, parking area and buildings are located. (Fig. 3). This community, which has been cleared in the past, is maintained by periodic mowing. Although it contains many native species, it also has a large number of non-native species. Since the field survey was done, a large portion of this community has been further disturbed by the addition of a layer of stony fill to a depth of a few centimetres to over a metre. In some areas the fill is contaminated with asphalt.

Figure 4: Photographs of C01- Dry, Sandy Meadow Ecosite after fill has been applied. Taken on May 4, 2021. Right-hand photo shows some of the original meadow.

Community 02 and 15 – Dry, Sandy Mixedwood Ecosite (G043N).

The hardwood canopy is a mixture of Sugar Maple, American Beech, American Basswood, Red Oak, Bur Oak, White Oak, Paper Birch, and Eastern Hop-hornbeam. Stand composition is highly variable. Understory tree species consists of moderate levels of Sugar Maple, Balsam Fir, Eastern Hop-hornbeam, White Oak and Red Oak. Common understory vegetation includes White-grained Mountain-ricegrass, Maple-leaved Viburnum, Hairy Solomon’s Seal, Long-stalked Sedge, Pennsylvania Sedge,

Hairy Sweet Cicely, Bracken Fern, Prickly Gooseberry, and Marginal Wood Fern. The substrate is sandy, mostly > 15 cm deep and dry (Fig. 5).

C15 is in two parts, both located in the southwest portion of the property. One part is found east of C16, and the other part is west of C16. The portion of C15 to the west of C16 contains the stream flow from W04 to W11. The stream flows through a small wet area which contains very large Silver Maple, White Oak and White Ash trees.

C02 is located to the south of C01 along the southern property boundary (Fig. 3).

Figure 5: Photograph of C02 - Dry, Sandy Mixedwood Ecosite (G043Tt).

Community 03: Moist, Coarse Hemlock-Cedar Ecosite (G066Tl).

The canopy is composed of > 50% Eastern White Cedar with Eastern Hemlock, Yellow Birch, Sugar Maple, American Elm and Black Ash. Little understory is present. Substrate is sandy to coarse loamy, mostly > 15 cm deep and moist (Fig. 6).

Community C03 is along the southern boundary site, south of C02 (Fig. 3).

Figure 6: Photograph of C03 - Moist, Coarse Hemlock-Cedar Ecosite

Community 04: Moist, Coarse Hemlock-Cedar Ecosite (G066TI)

The canopy is composed of > 50% Eastern White Cedar, with Balsam Fir, Red Maple, Paper Birch, Sugar Maple, and White Spruce. Understory tree species consisting of moderate levels of Balsam Fir, Yellow Birch, Sugar Maple, and Red Maple. Shrub cover is moderately poor and herb cover is moderately rich (Fig. 7). The substrate is sandy to coarse loamy, mostly > 15 cm deep and moist. C04 is located around the edge of W02 (Fig. 3).

Figure 7: Photograph of C04 - Moist, Coarse Hemlock-Cedar Ecosite.

Community 05: Organic Meadow Marsh Ecosite (G144N)

Wetland 01, 02, 04, 05, 06, 08 & 09.

C05 is dominated by sedges and grasses with some forbs. Herbaceous cover is >50%. A few trees are present including Tamarack, Black Ash, and White Spruce but tree cover does not exceed 10%. Tall shrub cover is $\leq 25\%$. Shrub species include Gray Alder, White Meadowsweet, Meadow Willow and Common Winterberry. Herbaceous species include Lake Sedge, Bristly Sedge, Bluejoint Reedgrass, Swamp Milkweed, Harlequin Blue Flag, Bog Buckbean, Bulb-bearing Water-hemlock, Marsh Cinquefoil, Royal Fern and Marsh Fern. Emergent plants include Broad-leaved Cattail, Cottongrass Bulrush and Soft-stemmed Bulrush. The abundance of Broad-leaved Cattail varies significantly from a few to co-dominant with sedges and grasses. The substrate is organic, deep, and wet to saturated (Fig. 8).

W02 is on the southern boundary and extends off the property to the southwest. W04, W05 and W06 are in the northcentral portion of the property. Wetlands W08 and W09 are to the east. (Fig. 3). Wetlands W07, W10 and W15 were not surveyed but appear to be Organic Meadow Marsh Ecosites as well.

Figure 8: Photograph of C05 - Organic Meadow Marsh Ecosite.

Community 06: Moist Coarse Aspen-Birch Hardwood Ecosite (G070Tt).

Trembling Aspen, Large-tooth Aspen, and Paper Birch dominate the tree species in the main canopy. Other trees include Sugar Maple, Red Oak, White Oak, Eastern Hop-hornbeam, Balsam Fir, Red Maple, White Ash, Eastern White Cedar, and White Spruce. Understory tree species include Balsam Fir, Sugar Maple, Red Maple, Large-toothed Aspen and Trembling Aspen. Shrub and herb cover moderately rich.

Common understory vegetation includes White-grained Mountain Ricegrass, Canada Fly Honeysuckle, Maple-leaved Viburnum, Downy Arrowwood, Northern Starflower, Wild Sarsaparilla, and Barren Strawberry. The vegetation in this community is highly variable. There are small areas of rock barren, cultural meadow, oak dominated hardwood forest and conifer dominated forest with the associated plant species, however, these areas are too small to be considered a separate ecosite. The substrate is sandy to coarse loamy, mostly > 15 cm deep and moist. (Fig. 9). C06 is found in the northwest section of the property (Fig. 3).

Figure 9: Photograph of C06 - Moist, Coarse Aspen-Birch Hardwood Ecosite.

Community 07: Organic Thicket Swamp Ecosite (G135S)

Wetland 03.

Deciduous shrub cover is > 25% and tree cover ≤ 10%. C07 contains a variable mix of tall and short shrub species including Gray Alder, Meadow Willow, and stunted Black Ash, Tamarack and Freeman Maple. Herb cover is moderately rich and includes Marsh Fern, Marsh Cinquefoil, Bulb-bearing Water-hemlock, Hemlock Water-parsnip, Bog Buckbean, Three-way Sedge, sedges, and grasses including Bluejoint Reedgrass. Emergents include Broad-leaved Cattails, Hard-stemmed Bulrush and Cottongrass Bulrush. Some pockets of standing water are present. The substrate is organic, mostly deep, and wet. (Fig. 10). W03, C07 is northeast of Wetland 02 and separated by a culvert. (Fig. 3).

Figure 10: Photograph of C07 - Organic Thicket Swamp Ecosite.

Community 08: Organic Open Water Marsh Ecosite (G152N).

Wetland 01, 04, 06 & 08

This ecosite is usually dominated by submergent aquatic plant species with $\leq 25\%$ emergent vegetation and $\leq 50\%$ floating-leaved vegetation. However, few submergent species were present. Emergent species include Broad-leaved Cattail, Soft-stemmed Bulrush. Floating-leaved species may include Variegated Pond-lily and Floating Pondweed. Water is normally above the substrate surface (less than 2 m deep); however, water levels were extremely low due to dry weather and in some locations the substrate was exposed. The substrate is organic and deep. The moisture regime is saturated. (Fig. 11). C08 is found in W01, W04, W06 and W08 located throughout the property. They are part of a network of wetlands connected by intermittent watercourses (Fig. 3).

Figure 11: Photograph of C08 – Organic Open Water Marsh Ecosite (in the background).

Community 09: Intolerant Hardwood Swamp Ecosite (G130Tt)

Wetland 03, 14 & 17.

The hardwood canopy is dominated by Black Ash with Large-toothed Aspen, Balsam Poplar, Paper Birch, Yellow Birch and Red Maple. Conifer species include Balsam Fir, Eastern White Cedar and White Spruce. Understory tree species consisting of Balsam Fir, Black Ash, Red Maple, Eastern White Cedar and White Spruce. Common understory vegetation includes Bunchberry, Small Enchanter's Nightshade, Dewberry, Goldthread, Creeping Snowberry, Wild Sarsaparilla, Northern Water-horehound, Naked Mitrewort, Common Oak Fern, Marsh Fern. Some standing water is present. Substrate is organic, deep, and very moist to wet. (Fig. 12). W03 is northeast of W02 and W14 is along the west boundary between the access road and Highway 28 (Fig. 3).

Figure 12: Photograph of C09 - Intolerant Hardwood Swamp Ecosite.

Community 10: Dry to Fresh Coarse Hemlock - Cedar Conifer Ecosite (G051Tt).

The conifer canopy consisting mostly of Eastern White Cedar and White Spruce with Eastern Hemlock and Balsam Fir. Other tree species include Sugar Maple, Red Maple, Northern Red Oak, White Ash, and American Elm. Understory tree species consisting of moderate levels of Balsam Fir, Eastern Hemlock, Red Maple, Sugar Maple, and White Ash. Common understory vegetation includes White-grained Mountain-ricegrass, Bunchberry, Bracken Fern, Large-leafed Aster, Wild-lily-of-the-valley, Wild Sarsaparilla, Northern Starflower, sedges, and other grasses. The vegetation in this community is highly variable. There are small areas of rock barren, cultural meadow with the associated plant species, however, these areas are too small to be shown on the ecosite map. The substrate is sandy to coarse loamy, mostly > 15 cm deep and dry to fresh (Fig. 13). C10 is in the northeast portion of the property (Fig. 3).

Figure 13: Photograph of C10 - Dry to Fresh Coarse Conifer Ecosite.

Community 11: Dry, Sandy Oak Hardwood Ecosite (G041Tt).

Red Oak dominates > 50% of the hardwood tree species in the main canopy. Other trees include Sugar Maple, White Ash, American Basswood, Eastern Hop-hornbeam, Large-toothed Aspen and Trembling Aspen. Understory trees consisting of Sugar Maple, Eastern Hop-hornbeam, Balsam Fir, and Red Oak. Understory vegetation includes Wild-lily-of-the-valley, Canada Fly Honeysuckle, Beak Hazel, Gay-wing Milkwort, White-grained Mountain-rice, Maple-leaved Viburnum and Wild Sarsaparilla. The substrate sandy, mostly > 15 cm deep and dry (Fig. 14). C11 is in the southeast portion of the property (Fig. 3).

Figure 14: Photograph of C11 – Dry, Sandy Oak Hardwood Ecosite.

Community 12: Dry, Sandy Red Pine – White Pine Conifer Ecosite (G033Tt).

C12 is mostly conifer (>50% relative cover) and dominated by Eastern White Pine with White Spruce, and Tamarack. Other trees include Paper Birch, Red Maple, American Basswood, Northern Red Oak, and American Elm. Understory tree species consisting of Red Maple, Eastern White Cedar, Eastern White Pine and White Spruce. Understory vegetation includes Hairy Solomon's Seal, White-grained Mountain Ricegrass, Gay-wing Milkwort, Wild Lily-of-the-valley, Wild Sarsaparilla, and Bracken Fern. The substrate is sandy, mostly > 15 cm deep and dry. (Fig. 15). C12 surrounds Wetland 04. (Fig. 3).

Figure 15: Photograph of C12 – Dry, Sandy Red Pine – White Pine Conifer Ecosite.

Community 13 – Dry, Sandy Red Pine – White Pine Mixedwood Conifer Ecosite (G039Tt).

Hardwoods dominated the canopy. Species include Northern Red Oak, Sugar Maple, White Oak, Bur Oak, Paper Birch, Large-toothed Aspen, Trembling Aspen, White Ash, American Basswood, Eastern Hophornbeam and American Elm. Eastern White Pine are the dominant conifer with White Spruce and Eastern Hemlock. Understory vegetation includes Canada Fly-honeysuckle, Hairy Solomon's Seal, White-grained Mountain Ricegrass, Gay-wing Milkwort, Wild Lily-of-the-valley, Wild Sarsaparilla, and Bracken Fern. The substrate is sandy, mostly > 15 cm deep and dry (Fig. 16). C13 is present in the southeast corner of the property (Fig. 3).

Figure 16: Photograph of C13 - Dry, Sandy Red Pine – White Pine Mixedwood Ecosite.

Community 14: Maple Hardwood Swamp Ecosite (G131Tt).

Wetland 12 & 13.

Maple species compose > 50% of hardwood tree species in the main canopy and include Freeman Maple, and Red Maple. Other trees include Black Ash, Bur Oak, Paper Birch, Balsam Fir, and American Elm. Common understory vegetation includes Red-osier Dogwood, Alder-leaved Buckthorn, Dewberry, Northern Water-horehound, Marsh Fern, Sensitive Fern, sedges, and grasses. Vernal pools and standing water are present. Substrate is organic, mostly deep, and very moist to saturated (Fig. 17). C14 (W12 & W13) is present in the southern portion of the property (Fig. 3).

Figure 17: Photograph of C14 - Maple Hardwood Swamp Ecosite.

Community 16: Very Shallow, Dry to Fresh Sparse Shrub Ecosite (G009S).

Absolute cover of all shrub species is 10-25%. Scattered small, open-grown trees often present, but do not exceed 10% absolute cover. Vegetation is highly variable consisting of opportunistic, drought tolerant species generally restricted to crevices and areas of shallow substrates. Shrub species include Common Juniper, White Meadowsweet, and Black Raspberry. Common tree species include Eastern White Pine, White Spruce, Bur Oak, White Ash, Eastern Hop-hornbeam, Black Cherry, Pin Cherry, and Balsam Poplar. Herbaceous plants include Poverty Oat Grass, Bracken Fern, Common Mullein, Wild Strawberry, Common Milkweed, Red Columbine, Heart-leaved Aster, Common Viper's Bugloss and Spreading Dogbane. The substrate is sandy, mostly very shallow (≤ 15 cm) and dry to fresh (Fig. 18). C16 is present in the southwest corner of the property (Fig. 3).

Figure 18: Photograph of C16 - Very Shallow, Dry to Fresh Sparse Shrub Ecosite.

Community 17: Mineral Meadow Marsh Ecosite (G142N).

Wetland 11.

C17 is dominated by sedges and grasses. Herbaceous cover is > 50% and anchored to the surface. Herbaceous species include American Sweetflag, Three-way Sedge, Water Smartweed, Broad-leaved Arrowhead, Marsh Fern. and Reed Canary Grass. Emergent species are $\leq 25\%$ and include Broad-leaved Cattail and Softstemmed Bulrush. The substrate is mineral, mostly deep, and very moist to saturated (Fig. 19). C17 (W11) is in the southwest corner of the property (Fig. 3).

Figure 19: Photograph of C17 - Mineral Meadow Marsh Ecosite (around the edge) and C18 - Open Water Marsh, Mineral Ecosite (in the center).

Community 18: Open Water Marsh, Mineral Ecosite (G151N).

Wetland 11

C18 is dominated by submergent species (*Chara sp.*), and floating-leaved species (Floating-leaved Pondweed). Water is permanently above the substrate surface and less than 2 m deep. Substrate is mineral and deep, and the moisture regime is saturated (Fig. 19). Both Community 17 & 18 comprise Wetland community 11, as shown in the photograph Fig. 19.

Community 19: Organic Rich Conifer Swamp Ecosite (G129Tt).

Wetland 16.

Conifer canopy consisting mostly of Eastern White Cedar, Balsam Fir, and White Spruce. Deciduous species include Black Ash, Red Maple, American Elm, Paper Birch, and Yellow Birch. Rich swamp indicators include Alder-leaved Buckthorn and Common Oak Fern are present. Understory tree species consisting of moderate

levels of Balsam Fir, Eastern White Cedar, and Black Ash. Common understory vegetation includes Naked Mitrewort, Small Enchanter's Nightshade, False Nettle, Crested Wood Fern, Royal Fern, Bunchberry, Norther Starflower, Goldthread, Northern Water-horehound. The substrate is organic, deep (> 40 cm) organic material and include shallow organic material over bedrock, and wet or saturated (Fig. 20). C19 is present in the northwest portion of the property (Fig. 3).

Figure 20: Photograph of C19 - Organic Rich Conifer Swamp Ecosite.

4.2.2 Flora Inventory by Area and ELC Ecosite

A total of 356 species of flora have been identified on the property. An analysis of flora was completed in Appendix I and a list of flora by community and ELC ecosite is included in Appendix II. The scientific and common names used for the flora in this report are consistent with those used by the Natural Heritage Information Centre (NHIC).

4.2.3 Floristic Quality Assessment by Area and ELC Vegetation Type

The Floristic Quality Assessment (FQA) provides an indication of the ecological condition of each community by summarizing the score for each species present in the community (Table 1, Appendix I). Five species identified during fieldwork were not present on the FQA list and so could not be included in this analysis. These species were, however, included in the species rarity list (Appendix IV). The Mean Coefficient of Conservatism scores for all areas varies from 2.2 to 7.0. A plant species with a higher score (e.g. 10) has a lower tolerance to environmental degradation such as overgrazing or development and therefore is found in undisturbed, natural habitats. Non-native plants reduce the overall scores, since they can persist in disturbed or marginal habitat. Consequently, the higher the Mean Coefficient of Conservatism, the more undisturbed the habitat is. Many of the communities on the property are in excellent condition in the context of settled southern Ontario.

Some of the upland communities having the best condition according to this analysis were Community 3, a Moist Hemlock - White Cedar forest; Community 12, a Dry Sandy Conifer forest; and Community 15, a Dry Sandy Mixedwood forest. The most disturbed communities, not surprisingly, were those adjacent the parking lot and buildings: Community 1, the dry, sandy meadow ecosite and Community 16, a dry, sparse shrubby ecosite had the lowest scores, reflecting the clearing of trees and the increased likelihood of non-native species invading open, unshaded communities. Nevertheless, even the communities in a somewhat disturbed condition provide habitat for a variety of native plants and animals.

Wetlands were generally in a less-disturbed condition than upland communities, probably because they have not been subject to logging and they are less likely to receive non-native species through foot and vehicle traffic, or the introduction of landscaping materials. **Wetlands having the highest scores were Community 5, an organic meadow marsh with a high level of species diversity; Community 7, an organic thicket swamp; Community 8, an open water marsh with organic soils; Community 9, an intolerant hardwood swamp with endangered Black Ash trees; and Community 18, an open-water marsh.**

The parking lot, trails and roads that have been used for logging and for recreation have been a vector for a variety of non-native species on the property. The weediness scores in Table 1 offer another means of assessing the level of human impact on the ecological communities and are generally in accordance with the results already presented for the Floristic Quality Index.

Table 1: Floristic Quality Assessment Summary.

Map Reference and ELC Community	Species Counts					Mean Coeff. Cons.		Total Weediness	Mean Wetness
	Total	Native	(%)	Non-Native	(%)	Natives only	Natives and Non-Natives

The complete list of flora species arranged according to S-Rank is included in Appendix IV. Black Ash and Butternut, both at-risk tree species, are detailed in a later report section on Threatened and Endangered Species. All other species of flora identified on site are listed as S4, S4?, S4S5, S5, S5? meaning that all the species are considered as native and common or abundant and secure within the province. Species ranked as SNA are not native to Ontario.

4.2.4 Fauna Species Lists by Area and ELC Vegetation Type

A total of 595 species of fauna arranged according to S-Rank were identified on the property. An additional 47 species were identified but were not included in the database because they are not included in the NHIC database. The list of fauna species by community and ELC ecosite is included in Appendix II. Although the avian fauna is listed by community and ELC ecosite, it does not imply that they are breeding. Some species may have been migrating through and others were observed soaring over (e.g., Turkey Vulture) while the observer was in a specific area.

The complete list of fauna arranged according to S-Rank is included in Appendix IV. The additional 47 species not included in the database are listed in Table 2. Four insects listed as S1, S1?, S3? and S3S4 were identified but are not designated by SARO or COSEWIC. Golden Eagle, listed as S2B, is designated an END species. Barn Swallow and Bobolink are listed as S4B, and designated THR species. The following species are all designated as Special Concern (SC) by SARO: Bald Eagle (S2N, S5B), Canada Warbler (S4B), Common Nighthawk (S4B), Eastern Wood Pewee (S4B), Monarch butterfly (S2N, S4B), Snapping Turtle (S4), and Wood Thrush (S4B) by SARO.

Western Chorus Frog has a Not at Risk status by SARO but THR by COSEWIC. Evening Grosbeak and Midland Painted Turtle have a Not at Risk status by SARO but SC by COSEWIC.

All remaining species are listed as S4, S4?, S4B, S4S5, S5, S5B, and considered native and common in the province, though some could be regionally rare. Species ranked as SNA are not native to Ontario. Forty-nine species entered in iNaturalist could not be imported into the database because their names were not found in the NHIC database (Table 2). The list includes 47 insects, one plant and one fungus.

Table 2: Species identified in iNaturalist but not in the NHIC database.

Scientific Name	Common Name
<i>Acronicta immodica</i>	Medium Oak Dagger
<i>Acronicta insita</i>	Large Gray Dagger
<i>Adelphocoris lineolatus</i>	Alfalfa Plant Bug
<i>Aethes sexdentata</i>	
<i>Agromyza vockerothi</i>	
<i>Anania hortulata</i>	Small Magpie
<i>Anicla infecta</i>	Green Cutworm Moth
<i>Apantesis virguncula</i>	Little Virgin Tiger Moth
<i>Apantesis williamsii</i>	Tiger Moth
<i>Archips semifera</i>	Oak Leafroller Moth
<i>Archips mouffetella</i>	
<i>Banasa calva</i>	
<i>Banasa dimidiata</i>	Green Burgundy Stink Bug
<i>Bellura vulnifica</i>	Black-tailed Diver Moth
<i>Ceraclea albimacula</i>	
<i>Chauliodes rastricornis</i>	Spring Fishfly
<i>Cliniodes ostreonalis</i>	Oystershell Metrea moth
<i>Corydalus cornutus</i>	Eastern Dobsonfly
<i>Depressaria depressana</i>	Purple Carrot-seed Moth
<i>Dibolia borealis</i>	Northern Plantain Flea Beetle
<i>Dichanthelium acuminatum</i>	Hairy Rosette Panicgrass
<i>Dichomeris marginella</i>	Juniper Webworm
<i>Elaphria alapallida</i>	Pale-winged Midget
<i>Epalpus signifer</i>	Early Tachinid Fly
<i>Eriophyes tiliae</i>	Red Nail Gall Mite
<i>Ethmia zelleriella</i>	Zeller's Ethmia
<i>Euschistus servus euschistoides</i>	
<i>Glaphyria sesquialis</i>	White-roped Glaphyria
<i>Gymnoscelis rufifasciata</i>	Double-striped pug
<i>Harmonia axyridis</i>	Asian Lady Beetle
<i>Korscheltellus lupulina</i>	Common Swift Moth
<i>Lethocerus americanus</i>	American giant water bug
<i>Lygaeus kalmii</i>	Small Milkweed Bug
<i>Lygropia rivulalis</i>	Bog Lygropia Moth
<i>Macaria exauspicata</i>	
<i>Macaria masquerata</i>	
<i>Okanagana rimosa</i>	Say's Cicada
<i>Pasiphila rectangularata</i>	Green Pug
<i>Pelochrista argentialbana</i>	
<i>Phellinus tremulae</i>	Aspen Bracket
<i>Phytomyza aralivora</i>	
<i>Plusia magnimacula</i>	
<i>Podiscus placidus</i>	
<i>Sehirus cinctus albonotatus</i>	
<i>Sitochroa palealis</i>	Carrot Seed Moth
<i>Sphecomyiella valida</i>	
<i>Sphinx poecila</i>	Northern Apple Sphinx
<i>Striacosta albicosta</i>	Western Bean Cutworm
<i>Trametes versicolour</i>	Turkey-tail

4.3 Significant Areas of Natural and Scientific Interest

No Provincially Significant ANSIs were identified on or nearby the site by MNRF (Figure 1).

4.4 Significant Portions of the Habitat of Endangered or Threatened Species

The Ontario Endangered Species Act (ESA, 2007) protects the habitat of Threatened or Endangered species in the province. Species designated as Special Concern are protected under regulations and policies for Significant Wildlife Habitat.

One dead Butternut listed as S2? and designated as Endangered (END) was found adjacent to the northeast corner of Community 05 (W04). No other Butternut trees were found. Black Ash is designated as Threatened (THR) federally, and Endangered (END) provincially. The species was listed under the Ontario Endangered Species Act (ESA) in January 2022, but the ministry chose to delay legal protection for two years. Black Ash is recognized as a critically endangered species globally and 51% of its range occurs in Canada. It is also of great cultural significance to many Indigenous Peoples. It was noted in several ecosites (C03, 05, 07, 09, 14, 19), but was most notable in Community 09 where the canopy was dominated by the species. AS a result this area is highlighted as key habitat for the species.

Golden Eagle, Bobolink and Barn Swallow were **observed on site**. Golden Eagle is unlikely to be breeding. Breeding habitat for Bobolink is marginal. Suitable nesting habitat for Barn Swallows may be present and should be confirmed. Western Chorus Frog (Federally Threatened) breeds in wetlands on the property.

Thirteen threatened or endangered species with **ranges overlapping with this part of Ecodistrict 5E-11 were identified**. Information and comments concerning their presence on the site are included in Table 3. Three of the species have been identified via the “*Atlas of the Breeding Birds of Ontario, 2001 – 2005*” (Cadman et al., 2007).

Table 3: Threatened and Endangered Species with ranges in Ecodistrict 5E-11.

Common Name	SARO Status	NHIC Record	OBBA Square 17QK24	Suitable Habitat on Site	Presence on the KNSC property.
Black Ash	END	No	N/A	Yes	Observed on site.
Eastern Whip-poor-will	THR	No	Probable	Yes	Not observed
Spotted Turtle	END	No	N/A	Yes	Not observed.
Blanding's Turtle	THR	No	N/A	Yes	Not observed
Eastern Hog-nose Snake	THR	No	N/A	Yes	Not observed
American Ginseng	END	No	N/A	Yes	Not observed
Cerulean Warbler	THR	No	No	Marginal	Not observed.
Eastern Meadowlark	THR	No	Possible	Marginal	Not observed
Bobolink	THR	No	No	Marginal	Not observed.
Chimney Swift	THR	No	No	No	Not observed
Barn Swallow	THR	No	Confirmed	No	Observed, may have suitable nesting structures.
Least Bittern	THR	No	No	No	Not observed
Bank Swallow	THR	No	No	No	Not observed. No suitable nesting habitat on site.

4.5 Significant Wetlands

No provincially significant wetlands (PSW) were identified on the site. However, very few wetlands have been evaluated in this part of Ontario, and a lack of evaluation does not reflect the quality or significance of the wetlands on the property. Many of the wetlands on the property are hydrologically connected, forming a wetland complex, and this increases the likelihood that they would be significant if evaluated (Fig. 2).

4.6 Fish Habitat

Baitfish were observed in W10 and W11, but not in the other wetlands. Water flows from W10 to W01, therefore baitfish are probably present in W01. Therefore, these three wetlands and associated watercourses are considered fish habitat: Significant Wildlife Habitat (Excluding Threatened and Endangered Species).

4.7 Significant Wildlife Habitat (SWH)

Based on a review of the following document, “*Significant Wildlife Habitat Criteria Schedules for Ecoregion 5E*” (MNR, 2015), seven (7) Candidate Significant Wildlife Habitats were identified as potential for the site (Table 4). The table indicates that some Significant Wildlife Habitat was confirmed on site and other SWH is likely on site but requires additional surveys.

Table 4: Significant Wildlife Habitat (Excluding Threatened and Endangered Species protected via the Ontario ESA).

Significant Wildlife Habitat	Confirming Criteria	Presence/Absence
Bat Maternity Colonies	Maternity colonies located in Mature (dominant trees > 80yrs old) deciduous or mixed forest stands, with >10/ha large diameter (>25cm dbh) wildlife trees. Confirmed use by; >10 Big Brown Bats >5 Adult Female Silver-hair Bats.	Study required to confirm.
Turtle Wintering Areas	Wintering areas are where water is deep enough not to freeze and have soft mud bottoms. Presence of 5 over-wintering Midland Painted Turtles or one or more Northern Map or Snapping Turtles within the wetland is significant.	Midland Painted Turtles were observed in W01 and W11. These are SWH.
Deer Yarding Areas	Deer yards mapped by MNRF	Confirm with MNRF.
Rock Barren	Areas >1 ha in size. Must have > 4 characteristic species.	Areas too small.
Rare Forest Type: White Oak.	Any forest stands with > 10% White Oak	Forest Management Plan shows one stand (W6) with 18% white oak = SWH Aligns with C02 in this report.
Woodland Raptor Nesting Habitat	Presence of 1 or more active nests from species list is considered significant.	OBBA confirms that the following species are breeders in area: Broad-winged Hawk, Barred Owl. This is SWH
Turtle and Lizard Nesting Areas	Presence of 5 or more nesting Midland Painted Turtles or one or more Northern Map Turtle or Snapping Turtle nesting is a SWH. Need study to confirm.	Midland Painted Turtles and Snapping Turtle reported on the property. Need studies to identify nesting sites.
Seeps and Springs	Presence of a site with 2 or more seeps/springs should be considered SWH.	Need studies to identify.
Aquatic Feeding Habitat	Observational studies of the moose feeding habitat observing use or track studies demonstrating use of the habitat are required for any candidate site; any candidate site with observed or demonstrated moose use is significant.	Probably not significant due to low numbers of moose. Need studies to confirm.

Denning Sites	Any known active denning site for Mink, Otter, Marten Fisher, Grey Wolf and Eastern Wolf and a 100 m radius around it is considered to be significant	Need studies to identify active denning sites.
Amphibian Breeding Habitat (Woodland).	Presence of a wetland >500m ² (about 25m diameter) within or adjacent to a woodland (no minimum size). Species include Eastern Newt, Blue-spotted Salamander, Spotted Salamander, Four-toed Salamander, Northern Two-lined Salamander, Spring Peeper, Wood Frog, and American Toad.	Numerous wetlands on site. Wood Frog and Spring Peeper identified on site. Other species on list are likely on site. Studies to confirm.
Amphibian Breeding Habitat (Wetlands)	Wetlands and pools (including vernal pools) >500m ² (about 25m diameter), supporting high species diversity are significant. Species include: Eastern Newt, American Toad, Spotted Salamander, Four-toed Salamander, Blue-spotted Salamander, Gray Treefrog, Western Chorus Frog, Northern Leopard Frog Pickerel, Frog Green, Frog Mink, and Frog Bullfrog	Numerous wetlands on site. Wood Frog and Spring Peeper identified on site. Other species on list are likely on site. Studies to confirm.
Mast Producing Areas.	Mature forests >0.5 ha with numerous large beech and red oak trees that supply the energy-rich mast that wildlife prefer. Other significant tree species include hickory, basswood, black cherry, ironwood, mountain ash, pin cherry, and butternut. Significant shrub species include blueberries, wild black berry, serviceberry, raspberry, beaked hazel, choke cherry and hawthorn.	C11 is dominated by Red Oak. Patches in other communities have large numbers of oak. These are SWH.
Special Concern and Rare Wildlife Species.	All Special Concern and Provincially Rare (S1-S3, SH) plant and animal species not listed as THR or END.	Bald Eagle (S2N, S5B), Canada Warbler (S4B), Common Nighthawk (S4B), Eastern Wood Pewee (S4B), Monarch butterfly (S2N, S4B), Snapping Turtle (S4), and Wood Thrush (S4B) identified on site and designated Special Concern (SC) by SARO. Their habitat is SWH.

5. Sensitivity Analysis

Generally, the documented presence of nesting or breeding species transforms 'candidate' SWH to 'confirmed'. Only a handful of habitats were 'confirmed' based on initial field surveys or were geographically referenced. Those that could be pinpointed are shown on the preliminary sensitivity map (Fig. 21) to highlight Club lands that are home to species at risk, high floristic quality or special habitat for wildlife (SWH).

Where an area had multiple designations, the higher sensitivity ranking is shown. This only occurred for a handful of communities, specifically the following:

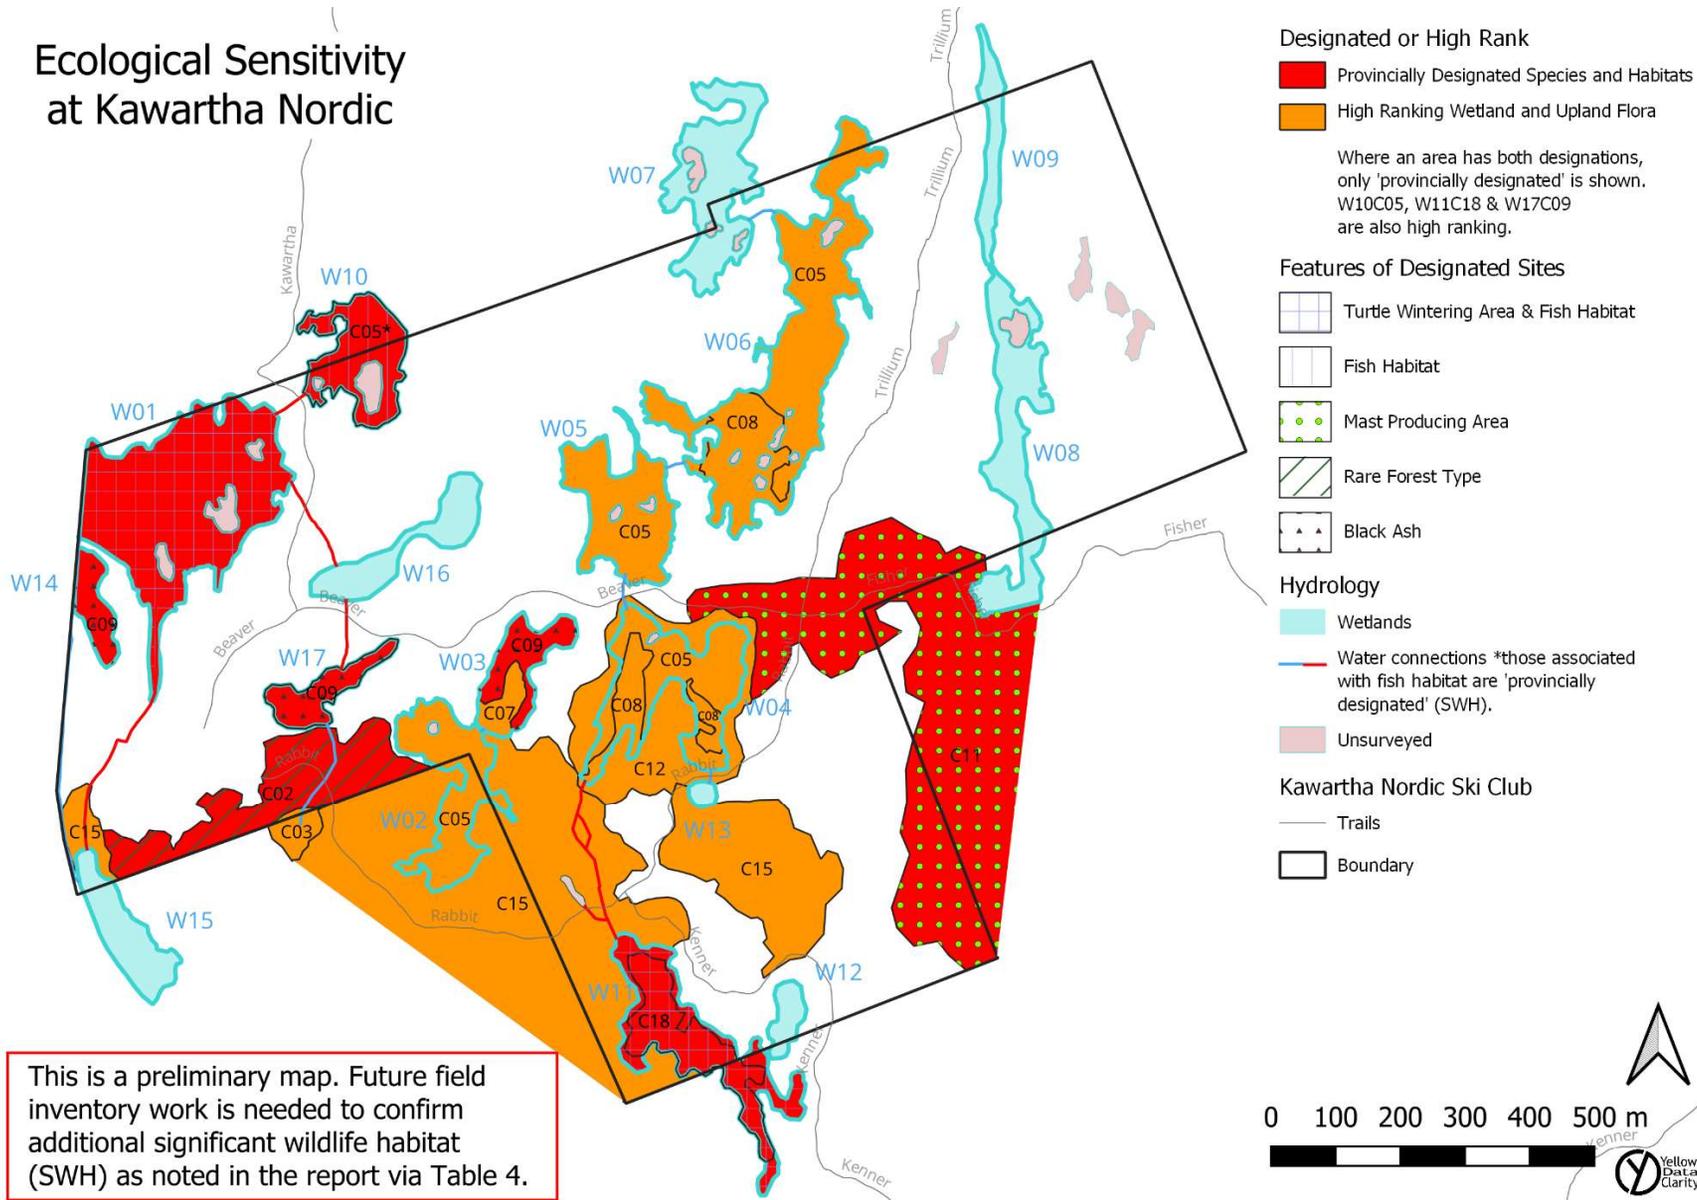

- Wetland 10 is recognized fish habitat; C05 in W10 has high floristic value.
- Wetland 11 is recognized fish habitat and turtle overwintering habitat; C18 within the wetland has high floristic value.
- Wetland 17 has high floristic quality and hosts endangered Black Ash.

Please note that the sensitivity map is very preliminary. Further field work is required to identify habitats where species at risk may be found. Frog and salamander surveys will confirm wetland and woodland habitats important to amphibian breeding, and deer wintering areas need to be confirmed via MNRF staff. The sensitivity map is presented here with the intent that more areas will be added pending field work noted in Table 4. This map is intended to distill natural features information from this report to be used as guidance for trail development and other human uses of the property.

5.1 Next Steps

While the work presented in this document is significant, it is only the first step in assessing the KNSC property. **Future inventory work is recommended to confirm significant wildlife habitats**, specifically the presence/nesting of the following species given that suitable breeding habitat/growing conditions exist: Eastern Whip-poor-will, Spotted Turtle, American Ginseng, Eastern Hog-nosed Snake, Blanding's Turtle. Table 4 lists additional studies to confirm SWH. **Wetlands on site warrant evaluation, particularly to assess the presence of fen indicator species and determine wetland significance.** As these features are investigated, they are to be added to the sensitivity map (Fig. 21) such that it becomes a living document, helping to ensure that human uses of the property are balanced with the protection of the outstanding natural features present at KNSC. Partnerships with organizations like the Peterborough Field Naturalists, Kawartha Land Trust and Fleming College may facilitate inventory activities.

Ecological Sensitivity at Kawartha Nordic

This is a preliminary map. Future field inventory work is needed to confirm additional significant wildlife habitat (SWH) as noted in the report via Table 4.

Figure 21: Preliminary sensitivity analysis of Kawartha Nordic Ski Club lands.

6. Conclusion

The authors and other volunteer observers have been impressed with the large, diverse wetlands on the property, the mature mixed and deciduous woodlands and areas of open rock barrens and meadows. The property provides habitat for species requiring large extents of forest, like Scarlet Tanager, Wood Thrush, Eastern Pewee and Ovenbird. Some of these species – Eastern Wood Pewee and Wood Thrush – have been identified as species at risk. Other at-risk species on the property include Western Chorus Frog and Black Ash. More at-risk reptiles and amphibians are likely to be discovered. Though there has been extensive logging in the past in some of the woodlands, there are still magnificent older specimens of White Oak, White Ash, Silver Maple, Sugar Maple and Eastern Hemlock. It is likely that almost all the pre-settlement complement of plants and animals still occurs on the property. The diversity of insect species alone on the property is quite amazing.

One of the great attributes of the property, from an ecological point of view, is that it is adjacent to large natural areas of Crown Land including the Peterborough Crown Game Preserve and the Kawartha Highlands Provincial Signature Park. Of course, members benefit from access to these lands for their ski trails too.

The trails, roads and landscaping materials on the property have brought with them a number of non-native species and have had an impact on the condition of adjacent ecological communities, but the overall condition of most communities, especially the wetland communities, is very good. Spreading gravel on trails, clearing of vegetation at the margins of roads and parking lot, and vehicular traffic are starting to encroach on the natural areas in the property. Especially significant is the introduction of a large quantity of aggregate fill to the area in front of the main cabin and the main trails and the expansion of the parking lot into the surrounding wetlands. It is recommended that the club carefully consider the impact of any further landscape changes on the outstanding natural heritage features of this property.

7 Acknowledgements

The authors would like to thank the volunteers who contributed observations that are included in this report: Colin Jones, Donald Sutherland, Warren Dunlop, Sue Sauve, Ian Attridge, Ben Taylor, Sheila Collett-Taylor, Joanne Culley, and Mike Burrell. The eBird data imported into the database included an observer ID but no name. Kent Todd contributed mapping expertise and Mark Woolley (Yellow Data Clarity) created the key maps included in this report. Thank you, all!

Floristic Quality Assessment

The Floristic Quality Assessment Methodology is based on the method of Wilhelm and Ladd (1988), adapted for Southern Ontario by Oldham, Bakowsky and Sutherland 1995 (Ontario Ministry of Natural Resources). G-rankings and S-rankings provided by OMNR Natural Heritage Information Centre and are current to the last imported NHIC update. Ecological land classification descriptions from Ecological Land Classification Field Guide FG-02 1998 (Lee et al). Output and summary data derived from MS Access. The FQA database application was first developed by Paul Nichol of Ecosystems in 1999 and regularly modified to reflect changed taxonomy in consultation with NHIC staff and/or databases such as VASCAN. Rankings are intended to provide a general overview of relative provincial (Srank) and global (Grank) ranking status and may not reflect current status and/or be inaccurate.
